CodeRabbit

An AI reviewer for your pull requests

Watch our tutorial video
youtu.be/oWojvsn6u-Y

Does this look fine?

modules/util/trimnames.go

```
 9 func TrimNames(names []string) []string {
10   out := make([]string, 0, len(names))
11   for i := 0; i <= len(names); i++ {
```

CodeRabbit Major

When i equals len(names), names[i] panics. That happens on every input, even an empty slice.

Suggested fix

```
- for i := 0; i <= len(names); i++ {
+ for i := 0; i < len(names); i++ {
```

```
12     out = append(out, strings.TrimSpace(names[i]))
13   }
14   return out
15 }
```

A real comment from **PR #88** in our Gitea repo.

The problem

AI agents now write code faster than people can review it, so reviewers get buried in pull requests and poorly prompted changes arrive as huge commits. CodeRabbit takes the first pass: it digs into each PR and leaves a detailed review. You stay in control, and reviewers can focus on the parts that matter.

How it works

- You open a pull request.
- CodeRabbit reads the change and posts a summary of it.
- It leaves line-by-line comments with suggested fixes, and runs your pre-merge checks.
- The review arrives within a few minutes. A person still approves the merge.

The rules live in `.coderabbit.yaml` in your repo. Ours adds pre-merge checks for our course's PR requirements. Here's how PR #88 did:

- ✗ Course PR description
- ✗ Tests for behaviour changes
- ✓ Screenshots for UI changes
- ✓ Breaking and dependency changes

Set it up in about 10 minutes

1. Sign in at **app.coderabbit.ai** with GitHub.
2. Install the CodeRabbit GitHub App and pick your repos. On an organization, an owner has to approve it.
3. Optional: add `.coderabbit.yaml` to the repo root with your own review rules.
4. Open a pull request and the review starts on its own. For a draft, comment `@coderabbitai review`.

Comment these on a PR

`@coderabbitai review`	Review new commits
`@coderabbitai full review`	Review the whole PR
`@coderabbitai rate limit`	Reviews left this hour
`@coderabbitai help`	List all commands
Reply to a comment	Ask any question

When to use it, and when not

Good fit

- ✓ Student teams and other teams where PRs wait on reviewers.
- ✓ Public, open-source repos, which get Team-plan features free.
- ✓ Keeping code quality up across many PRs.

Watch out for

- **It's AI.** Some comments are wrong or nitpicky. Treat them as suggestions and keep a human approval.
- **Limits.** New organizations get a 14-day Advanced trial with 10 reviews an hour (what we demo). After that, public repos get 1 to 10 an hour depending on stars, and private repos on the free plan get summaries only.
- **Cost.** Paid plans start at $24 per developer per month, billed annually, and still have rate limits.
- **Sensitive code.** Your diff goes to a third-party service.
